

Ibrahim Abdulquadri

Backend Software Engineer

Lagos, Nigeria | ibrahimabdulquadri446@gmail.com | github.com/ibrahimabdulquadri101 | linkedin.com/in/ibrahim-abdulquadri-abiodun

SUMMARY

Backend focused software engineer with production experience across NestJS, Node.js, and PostgreSQL, C++ systems programming. Currently building with Workconnect.africa, a live job platform, with an AI powered CV scorer and real production ownership.

EDUCATION

Federal University of Technology, Akure (FUTA) Feb 2024 – Feb 2028

B.Tech, Software Engineering, 4th Year · Co-Technical Lead, GDG on Campus · Mentored 50+ students in frontend development

EXPERIENCE

Full-Stack Engineer May 2026 – Present

Workconnect.africa — Remote

- Build and maintain a job platform for the Nigerian market: a NestJS and PostgreSQL backend, a Next.js frontend, and a scheduled crawler that pulls and normalizes job listings from external sources.
- Shipped a CV scoring feature backed by the OpenAI API, giving job seekers instant, structured feedback on their resumes, with an animated dial on the frontend to visualize the score.
- Own features end to end in production, including diagnosing a silent cron job failure behind stale data, fixing CORS and JWT signature mismatches, and stabilizing deployments across Railway and Netlify.

Backend Developer Intern Finalist Oct 2025 – Dec 2025

HNG i13 · DEENAI — Remote

- Built RESTful APIs in NestJS and TypeScript for waitlist registration, chat message persistence, and AI token management, with role based authorization and PostgreSQL schemas via TypeORM.
- Secured admin only endpoints with JWT and custom Guards, documented every endpoint in Swagger/OpenAPI, and containerized services with Docker for a consistent team environment.

Full Stack Developer Feb 2025 – Jun 2025

ShopMaster — Remote

- Built a complete auth system in Next.js 14 (App Router) covering registration, login, and password reset, using JWT with HTTP only cookies to keep tokens out of client side JavaScript.
- Implemented role based access control across inventory management features, and used server side rendering to cut initial load time and improve SEO on customer facing pages.

Frontend Developer Dec 2023 – Dec 2024

Halafund — Lagos, Nigeria

- Built responsive interfaces in React, TypeScript, and Tailwind CSS with a mobile first approach, cut page load times through code splitting and lazy loading, and collaborated with backend engineers and designers in Agile sprints.

PROJECTS

Load Balancer — C++

- Built a TCP load balancer with round-robin backend selection, health checks that mark dead servers and re-enable them on recovery, and a CLI for live stats, groundwork for how tools like NGINX and HAProxy work underneath.

Tiny Search Engine — C++

- Built a search engine from scratch with an inverted index, TF-IDF ranking, multi-word AND queries, and disk backed persistence, using nothing but the C++ standard library.

Mini Auth & Payment API — NestJS, TypeORM, PostgreSQL, Paystack

- Built an auth and payment API with Google OAuth, JWT, an API key system with granular permissions, and wallet transactions using pessimistic locking to prevent race conditions, plus Paystack webhook verification via HMAC signatures.

Collaborative Todo List API — Node.js, Express, MongoDB, WebSocket

- Built a real-time task manager with WebSocket sync, optimistic concurrency control through version numbers, three-tier role permissions, and a full activity log with timeline and export.

SKILLS

Languages: JavaScript (ES6+), TypeScript, C++, SQL

Backend: Node.js, Express.js, NestJS, RESTful APIs, WebSockets, Microservices, JWT, OAuth 2.0, RBAC

Frontend: React.js, Next.js, React Native, Redux, Zustand, Tailwind CSS

Data & Tools: PostgreSQL, MongoDB, MySQL, Redis, TypeORM, Docker, AWS, Vercel, Railway, Linux, Postman, Swagger, Jest
